TEST PLAN

Objective

The objective is to test some of the code that was implemented in the previous iteration and also to test the code that will be implemented in this iteration.

What to test and how

We are going to test Use Case 3 (Quit Game) and Use Case 2 (Play Game) by running dynamic test-cases. Use Case 2 will not be tested until the functionality to run that use-case is implemented. The reason for choosing to test Use Case 2 was to see if it is possible to exit the application. The reason for choosing Use Case 2 was to test if it was possible to play through the game the way that the Use Case described it. We will also write automated unit test for the methods "getFilesInDir" and "getJsonFile" in the FileReader Class. The method getFilesInDir will have two tests and getJsonFile will have three tests.

Time Plan

Task	Estimated Time	Actual
Writing Manual Test Cases	2 h	3 h
Running the manual tests	30 min	
Writing Unit tests	4 h	6 h
Writing a reflection	1 h	

MANUAL TEST-CASES

TC 3.1 To quit the game

Use case: UC3 Quit Game

Scenario: To quit the game

The main scenario of UC3 is tested when the player successfully quits the game.

Precondition: The game should be started

Test steps

- The system shows the menu with a selected menu item. (The selected item has a blue color and a greater-than sign to the left of the text)
- By using the arrow keys on the keyboard, select the menu item with the text "Quit Game" and press the enter key.
- The system displays the text "Are you sure you want to quit" and asks the player to confirm by entering the letter y or n.
- By using the keyboard, enter the letter y and press enter.

Expected

- The system should now be exited
-

TC 2.1 Winning the game

Use case: UC2 Play Game

Scenario: Playing the game and winning

The main scenario of UC2 is tested when the player successfully wins a game of hangman.

Precondition: The game should be started by entering "npm start test".

Test steps

- The system displays the text "Guessed Letters:", a drawing of the "gallows pole", the text "Placeholders: __" and asks the user to enter a letter.
- By using the keyboard, enter the letter t the press enter.
- The system displays the text "Guessed Letters: t", a drawing of the "gallows pole", the text "Placeholders: t_" and asks the user to enter a letter.
- By using the keyboard, enter the letter e the press enter.

Expected

- The system presents the texts "YOU WIN", "Wrong Guesses: 0" and "Correct Word: te"
 - The system asks the player to play again.
-

UNIT TESTS

The methods that will be tested "getFilesInDir" and "getJsonFile" in the FileReader class. The getFilesInDir method will have two tests and the getJsonFile will have three test.

Unit tests for getFilesInDir

The function takes a file path to a directory as an argument and returns the files in that directory as an array. If the directory does not exist, the function should throw an exception.

Test 1 will test if the function throws an exception if the directory does not exist.

Test 2 will test if the function returns the files in a specific directory.

```
5 // Test for the getFilesInDir method in the FileReader Class
6
7 Test 1
8 it('Should throw an exception', async () => {
9   const sut = new FileReader()
10   const input = './src/fake-directory'
11
12   await expect(sut.getFilesInDir(input)).rejects.toThrow()
13 })
14 Test 2
15 it('Should return the array ["1.json", "2.json", "notafile.txt"]', async () => {
16   const sut = new FileReader()
17   const input = './src/test-folder'
18   const expectedResult = ['1.json', '2.json', 'notafile.txt']
19
20   await expect(sut.getFilesInDir(input)).resolves.toEqual(expectedResult)
21 })
```

Unit test for getJsonFile

The function takes a file path to a specific json file as an argument and returns the json file converted to a javascript object. If the passed file path does not exist, the function should throw an exception. If the passed file is not an json file, the function should throw an exception.

Test 1 will test if the function throws an exception if the passed file does not exist.

Test 2 will test if the function throws an exception if the passed file is not a json file.

Test 3 will test if the function returns a specific javascript object when passed an existing json file.

```
22 // Test for the getJsonFile method in the FileReader Class
23 it('Should throw an exception', async () => {
24     const sut = new FileReader()
25     const input = './src/word-lists/notafile.json'
26
27     await expect(sut.getJsonFile(input)).rejects.toThrow()
28 })
29
30 it('Should throw an exception', async () => {
31     const sut = new FileReader()
32     const input = './src/test-folder/notafile.txt'
33
34     await expect(sut.getJsonFile(input)).rejects.toThrow()
35 })
36
37 it('Should return the object "{ one: test1, two: test2 }"', async () => {
38     const sut = new FileReader()
39     const input = './src/test-folder/1.json'
40     const expectedResult = { one: 'test1', two: 'test2' }
41
42     await expect(sut.getJsonFile(input)).resolves.toEqual(expectedResult)
43 })
44
```

Test 1

Test 2

Test 3

Test result

```
FAIL src/test/test.test.js
  ✓ Should throw an exception (10ms)
  ✓ Should return the array ["1.json", "2.json", "notafile.txt"] (7ms)
  ✓ Should throw an exception (1ms)
  ✓ Should throw an exception (1ms)
  ✓ Should return the object "{ one: test1, two: test2 }" (4ms)
  ✗ Should return true (4ms)

● Should return true

  expect(received).toBe(expected) // Object.is equality

  Expected: true
  Received: false

   51 |     const expectedResult = true
   52 |
>  53 |     expect(sut.checkWordComplete(input1, input2)).toBe(expectedResult)
      |                                                    ^
   54 |   })
   55 |
